6	Preface	6
7	Part A – Simulation Exercise Lab	16
8	Implement three nodes point – to – point network with duplex links between them. Set the queue size, vary the bandwidth and find the number of packets dropped	16
9	Implement transmission of ping messages/trace route over a network topology consisting of 6 nodes and find the number of packets dropped due to congestion.	20
10	Implement an Ethernet LAN using n nodes and set multiple traffic nodes and plot congestion window for different source / destination	26
11	Implement simple ESS and with transmitting nodes in wire-less LAN by simulation and determine the performance with respect to transmission of packets.	24
12	Implement and study the performance of GSM on NS2/NS3 (Using MAC layer) or equivalent environment.	30
13	Implement and study the performance of CDMA on NS2/NS3 (Using stack called Call net) or equivalent environment.	34
14	Part B – Programming Exercises	40
15	Write a program for error detecting code using CRC-CCITT (16- bits).	44
16	Write a program to find the shortest path between vertices using bellman-ford algorithm.	47
17	Using TCP/IP sockets, write a client – server program to make the client send the file name and to make the server send back the contents of the requested file if present. Implement the above program using as message queues or FIFOs as IPC channels.	51
18	Write a program on datagram socket for client/server to display the messages on client side, typed at the server side.	53
20	Write a program for congestion control using leaky bucket algorithm	56

21	Viva Questions	59
22	Scheme of evaluation of Rubrics	61

VISION AND MISSION OF INSTITUTE

- **Vision**
 - **To be one of the premier Institutes of Engineering and Management education in the country.**
- **Mission**
 - **To provide Engineering and Management education that meets the needs of human resources in the country.**
 - **To develop leadership qualities, team spirit and concern for environment in students.**

VISION AND MISSION OF DEPARTMENT

- **Vision**
 - **To be a premier department for education in Computer Science and Engineering in Visvesvaraya Technological University, moulding students into professional engineers.**
- **Mission**
 - **To provide teaching/ learning facilities in Computer Science and Engineering better than prescribed by University for easy adaptation to industry and higher learning.**
 - **Provide a platform for self learning to meet the challenges of changing technology and inculcate team spirit and leadership qualities to succeed in professional career.**
 - **Comprehend the societal needs and environmental concerns in the field of Computer Science**

PROGRAM OUTCOMES

Engineering Graduates will be able to:

- 1. Engineering knowledge:** Apply the knowledge of mathematics, science, engineering fundamentals, and an engineering specialization to the solution of complex engineering problems.
- 2. Problem analysis:** Identify, formulate, review research literature, and analyze complex engineering problems reaching substantiated conclusions using first principles of mathematics, natural sciences, and engineering sciences.
- 3. Design/development of solutions:** Design solutions for complex engineering problems and design system components or processes that meet the specified needs with appropriate consideration for the public health and safety, and the cultural, societal, and environmental considerations.
- 4. Conduct investigations of complex problems:** Use research based knowledge and research methods including design of experiments, analysis and interpretation of data, and synthesis of the information to provide valid conclusions.
- 5. Modern tool usage:** Create, select, and apply appropriate techniques, resources, and modern engineering and IT tools including prediction and modeling to complex engineering activities with an understanding of the limitations.
- 6. The engineer and society:** Apply reasoning informed by the contextual knowledge to assess societal, health, safety, legal and cultural issues and the consequent responsibilities relevant to the professional engineering practice.
- 7. Environment and sustainability:** Understand the impact of the professional engineering solutions in societal and environmental contexts, and demonstrate the knowledge of, and need for sustainable development.
- 8. Ethics:** Apply ethical principles and commit to professional ethics and responsibilities and norms of the engineering practice.
- 9. Individual and team work:** Function effectively as an individual, and as a member or leader in diverse teams, and in multidisciplinary settings.
- 10. Communication:** Communicate effectively on complex engineering activities with the engineering community and with society at large, such as, being able to comprehend and write effective reports and design documentation, make effective presentations, and give and receive clear instructions.
- 11. Project management and finance:** Demonstrate knowledge and understanding of the engineering and management principles and apply these to one's own work, as a member and leader in a team, to manage projects and in multidisciplinary environments.
- 12. Life-long learning:** Recognize the need for, and have the preparation and ability to engage in independent and life-long learning in the broadest context of technological change.

Course Outcome:

Upon successful completion of this Lab the student will be capable of:

- i. Analyze and Compare various networking protocols.
- ii. Demonstrate the working of different concepts of networking.
- iii. Implement, analyze and evaluate networking protocols in NS2 / NS3

Conduction of Practical Examination:

1. All laboratory experiments are to be included for practical examination.
2. Students are allowed to pick one experiment from part A and part B with lot.
3. Strictly follow the instructions as printed on the cover page of answer script
4. Marks distribution: Procedure + Conduction + Viva: 60

Part A: 5+20+5 =30

Part B: 5+20+5 =30

5. Change of experiment is allowed only once and marks allotted to the procedure part to be made zero

Preface:

Computer Networks laboratory covers the implementation of basic networking concepts and simulation of advanced concepts. The prerequisite for this laboratory is the understanding of fundamentals of computer networks. There are two parts in this laboratory. The first part deals with simulation of networking concepts. The second part deals with how to implement the message transfer among the systems using inter process communication (IPC) techniques, security algorithms, routing algorithms, error detection and flow and congestion control techniques.

Network Simulation Using NS2:

Network simulation is an important tool in developing, testing and evaluating network protocols. Simulation can be used without the target physical hardware, making it economical and practical for almost any scale of network topology and setup. It is possible to simulate a link of any bandwidth and delay, even if such a link is currently impossible in the real world. With simulation, it is possible to set each simulated node to use any desired software. Most network simulators use abstractions of network protocols, rather than the real thing, making their results less convincing. S.Y. Wang reports that the simulator OPNET uses a simplified finite state machine to model complex TCP protocol processing. NS-2 uses a model based on TCP, it is implemented as a set of classes using inheritance.

Wang states that “Simulation results are not as convincing as those produced by real hardware and software equipment.” This statement is followed by an explanation of the fact that most existing network simulators can only simulate real life network protocol implementations with limited details, which can lead to incorrect results. Another paper includes a similar statement, “running the actual TCP code is preferred to running an abstract specification of the protocol.” Brakmo and Peterson go on to discuss how the BSD implementations of TCP are quite important with respect to timers. Simulators often use more accurate round trip time measurements than those used in the BSD implementation, making results differ.

Starting ns

You start ns with the command 'ns <tclscript>' (assuming that you are in the directory with the ns executable, or that your path points to that directory), where '<tclscript>' is the name of a Tcl (Tool Command Language) script file which defines the simulation scenario (i.e. the topology and the events). You can also just start ns without any arguments and enter the Tcl commands in the Tcl shell, but that is definitely less comfortable.

Starting nam (Network Animator):

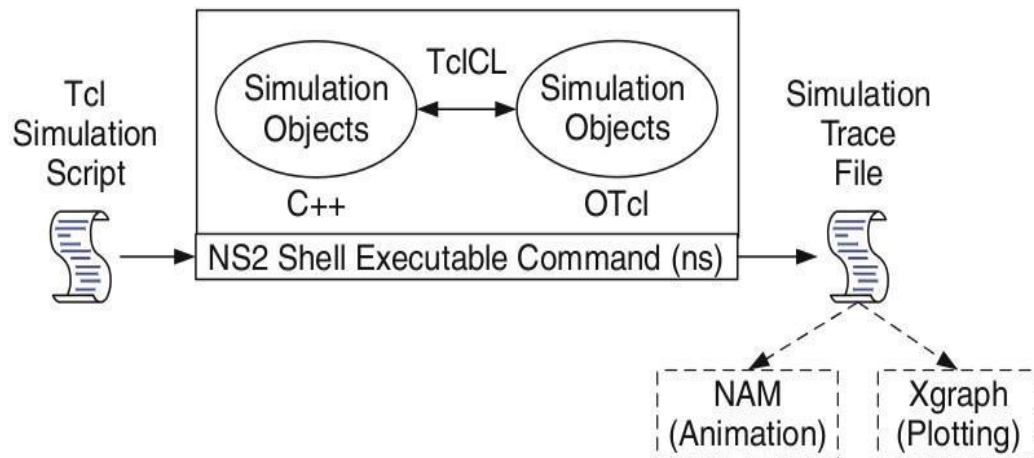

You can either start nam with the command 'nam <nam-file>' where '<nam-file>' is the name of a nam trace file that was generated by ns, or you can execute it directly out of the Tcl simulation script for the simulation which you want to visualize.

Introduction to NS-2

- Widely known as NS2, is simply an event driven simulation tool.
- Useful in studying the dynamic nature of communication networks.

- Simulation of wired as well as wireless network functions and protocols (e.g., routing algorithms, TCP, UDP) can be done using NS2.
- In general, NS2 provides users with a way of specifying such network protocols and simulating their corresponding behaviours.

Basic Architecture of NS2

Tcl scripting

- Tcl is a general purpose scripting language. [Interpreter]
- Tcl runs on most of the platforms such as Unix, Windows, and Mac.
- The strength of Tcl is its simplicity.
- It is not necessary to declare a data type for variable prior to the usage.

Basics of TCL

Syntax: command arg1 arg2 arg3

- **Hello World!**

```
puts stdout{Hello,
World!} Hello, World!
```

- **Variables** Command Substitution

```
set a 5          set len [string length foobar]
set b $a         set len [expr [string length foobar] + 9]
```

- **Simple Arithmetic**

```
expr 7.2 / 4
```

- **Procedures**

```
proc Diag {a b} {
set c [expr sqrt($a * $a + $b *
$b)] return $c }
puts "Diagonal of a 3, 4 right triangle is [Diag 3
4]" Output: Diagonal of a 3, 4 right triangle is 5.0
```

- **Loops**

<pre>while{\$i < \$n} { ... }</pre>	<pre>for {set i 0} {\$i < \$n} {incr i} { ... }</pre>
--	--

Wired TCL Script Components

- Create the event scheduler
- Open new files & turn on the tracing
- Create the nodes
- Setup the links
- Configure the traffic type (e.g., TCP, UDP, etc)
- Set the time of traffic generation (e.g., CBR, FTP)
- Terminate the simulation

NS Simulator Preliminaries.

1. Initialization and termination aspects of the ns simulator.
2. Definition of network nodes, links, queues and topology.
3. Definition of agents and of applications.
4. The nam visualization tool.
5. Tracing and random variables.

Initialization and Termination of TCL Script in NS-2

An ns simulation starts with the command

```
set ns [new Simulator]
```

Which is thus the first line in the tcl script? This line declares a new variable as using the set command, you can call this variable as you wish, In general people declares it as ns because it is an instance of the Simulator class, so an object the code[new Simulator] is indeed the installation of the class Simulator using the reserved word new.

In order to have output files with data on the simulation (trace files) or files used for visualization (nam files), we need to create the files using “open” command:

#Open the Trace file

```
set tracefile1 [open out.tr w]
$ns trace-all $tracefile1
```

#Open the NAM trace file

```
set namfile [open out.nam w]
$ns namtrace-all $namfile
```

The above creates a data trace file called “out.tr” and a nam visualization trace file called “out.nam”. Within the tcl script, these files are not called explicitly by their names, but instead by pointers that are declared above and called “tracefile1” and “namfile” respectively. Remark that they begins with a # symbol. The second line open the file “out.tr” to be used for writing, declared with the letter “w”. The third line uses a simulator method called trace-all that have as parameter the name of the file where the traces will go.

The last line tells the simulator to record all simulation traces in NAM input format. It also gives the file name that the trace will be written to later by the command \$ns flush-trace. In our case, this will be the file pointed at by the pointer “\$namfile”, i.e the file “out.tr”.

The termination of the program is done using a “finish” procedure.

#Define a ‘finish’ procedure

```
Proc finish { } {  
    global ns tracefile1 namfile  
    $ns flush-trace  
    Close $tracefile1  
    Close $namfile  
    Exec nam out.nam &  
    Exit 0  
}
```

The word **proc** declares a procedure in this case called **finish** and without arguments. The word **global** is used to tell that we are using variables declared outside the procedure. The simulator method “**flush-trace**” will dump the traces on the respective files. The tcl command “**close**” closes the trace files defined before and **exec** executes the nam program for visualization. The command **exit** will end the application and return the number 0 as status to the system. Zero is the default for a clean exit. Other values can be used to say that is a exit because something fails.

At the end of ns program we should call the procedure “finish” and specify at what time the termination should occur. For example,

```
$ns at 125.0 “finish”
```

will be used to call “**finish**” at time 125sec. Indeed, the **at** method of the simulator allows us to schedule events explicitly.

The simulation can then begin using the command

```
$ns run
```

Definition of a network of links and nodes

The way to define a node is

```
set n0 [$ns node]
```

We created a node that is printed by the variable **n0**. When we shall refer to that node in the script we shall thus write **\$n0**.

Once we define several nodes, we can define the links that connect them. An example of a definition of a link is:

```
$ns duplex-link $n0 $n2 10Mb 10ms DropTail
```

Which means that **\$n0** and **\$n2** are connected using a bi-directional link that has 10ms of propagation delay and a capacity of 10Mb per sec for each direction.

To define a directional link instead of a bi-directional one, we should replace “duplex-link” by “simplex-link”.

In NS, an output queue of a node is implemented as a part of each link whose input is that node. The definition of the link then includes the way to handle overflow at that queue.

In our case, if the buffer capacity of the output queue is exceeded then the last packet to arrive is dropped. Many alternative options exist, such as the RED (Random Early Discard) mechanism, the FQ (Fair Queuing), the DRR (Deficit Round Robin), the stochastic Fair

Queuing (SFQ) and the CBQ (which including a priority and a round-robin scheduler).

In ns, an output queue of a node is implemented as a part of each link whose input is that node. We should also define the buffer capacity of the queue related to each link. An example would be:

```
#set Queue Size of link (n0-n2) to 20  
$ns queue-limit $n0 $n2 20
```

Agents and Applications

We need to define routing (sources, destinations) the agents (protocols) the application that use them.

FTP over TCP

TCP is a dynamic reliable congestion control protocol. It uses Acknowledgements created by the destination to know whether packets are well received.

There are number variants of the TCP protocol, such as Tahoe, Reno, NewReno, Vegas. The type of agent appears in the first line:

```
set tcp [new Agent/TCP]
```

The command **\$ns attach-agent \$n0 \$tcp** defines the source node of the tcp connection.

The command

```
set sink [new Agent /TCPSink]
```

Defines the behaviour of the destination node of TCP and assigns to it a pointer called sink.

#Setup a UDP connection

```
set udp [new Agent/UDP]  
$ns attach-agent $n1 $udp  
set null [new Agent/Null]  
$ns attach-agent $n5 $null  
$ns connect $udp $null  
$udp set fid_2
```

#setup a CBR over UDP connection

```
set cbr [new Application/Traffic/CBR]  
$cbr attach-agent $udp  
$cbr set packetsize_ 100  
$cbr set rate_ 0.01Mb  
$cbr set random_ false
```

Above shows the definition of a CBR application using a UDP agent

The command **\$ns attach-agent \$n4 \$sink** defines the destination node. The command

\$ns connect \$tcp \$sink finally makes the TCP connection between the source and destination nodes.

TCP has many parameters with initial fixed defaults values that can be changed if mentioned explicitly. For example, the default TCP packet size has a size of 1000bytes. This can be changed to another value, say 552bytes, using the command **\$tcp set packetSize_ 552**.

When we have several flows, we may wish to distinguish them so that we can identify them with different colors in the visualization part. This is done by the command **\$tcp set fid_ 1** that assigns to the TCP connection a flow identification of “1”. We shall later give the flow identification of “2” to the UDP connection.

CBR over UDP

A UDP source and destination is defined in a similar way as in the case of TCP.

Instead of defining the rate in the command **\$cbr set rate_ 0.01Mb**, one can define the time interval between transmission of packets using the command.

```
$cbr set interval_ 0.005
```

The packet size can be set to some value using

```
$cbr set packetSize_ <packet size>
```

Scheduling Events

NS is a discrete event based simulation. The tcp script defines when event should occur. The initializing command **set ns [new Simulator]** creates an event scheduler, and events are then scheduled using the format:

```
$ns at <time> <event>
```

The scheduler is started when running ns that is through the command **\$ns run**. The beginning and end of the FTP and CBR application can be done through the following command

```
$ns at 0.1 "$cbr start"
$ns at 1.0 "$ftp start"
$ns at 124.0 "$ftp stop"
```

Structure of Trace Files

When tracing into an output ASCII file, the trace is organized in 12 fields as follows in fig shown below, The meaning of the fields are:

Event	Time	From Node	To Node	PKT Type	PKT Size	Flags	Fid	Src Addr	Dest Addr	Seq Num	Pkt id
-------	------	-----------	---------	----------	----------	-------	-----	----------	-----------	---------	--------

1. The first field is the event type. It is given by one of four possible symbols r, +, -, d

which correspond respectively to receive (at the output of the link), enqueued, dequeued and dropped.

2. The second field gives the time at which the event occurs.
3. Gives the input node of the link at which the event occurs.
4. Gives the output node of the link at which the event occurs.
5. Gives the packet type (eg CBR or TCP)
6. Gives the packet size
7. Some flags
8. This is the flow id (fid) of IPv6 that a user can set for each flow at the input OTcl script one can further use this field for analysis purposes; it is also used when specifying stream color for the NAM display.
9. This is the source address given in the form of “node.port”.
10. This is the destination address, given in the same form.
11. This is the network layer protocol’s packet sequence number. Even though UDP implementations in a real network do not use sequence number, ns keeps track of UDP packet sequence number for analysis purposes
12. The last field shows the unique id of the packet.

XGRAPH

The xgraph program draws a graph on an x-display given data read from either data file or from standard input if no files are specified. It can display upto 64 independent data sets using different colors and line styles for each set. It annotates the graph with a title, axis labels, grid lines or tick marks, grid labels and a legend.

Syntax:

Xgraph [options] file-name

Options are listed here

/-bd <color> (Border)

This specifies the border color of the xgraph window.

/-bg <color> (Background)

This specifies the background color of the xgraph window.

/-fg<color> (Foreground)

This specifies the foreground color of the xgraph window.

/-lf <fontname> (LabelFont)

All axis labels and grid labels are drawn using this font.

/-t<string> (Title Text)

This string is centered at the top of the graph.

/-x <unit name> (XunitText)

This is the unit name for the x-axis. Its default is “X”.

/-y <unit name> (YunitText)

This is the unit name for the y-axis. Its default is “Y”.

Awk- An Advanced

awk is a programmable, pattern-matching, and processing tool available in UNIX. It works equally well with text and numbers.

awk is not just a command, but a programming language too. In other words, awk utility is a pattern scanning and processing language. It searches one or more files to see if they contain lines that match specified patterns and then perform associated actions, such as writing the line to the standard output or incrementing a counter each time it finds a match.

Syntax:

awk option ‘selection_criteria {action}’ file(s)

Here, `selection_criteria` filters input and select lines for the action component to act upon. The `selection_criteria` is enclosed within single quotes and the action within the curly braces. Both the `selection_criteria` and action forms an awk program.

Example: `$ awk '/manager/ {print}' emp.lst`

Variables

Awk allows the user to use variables of their choice. You can now print a serial number, using the variable `kount`, and apply it to those directors drawing a salary exceeding 6700:

```
$ awk -F'|' ' $3 == "director" && $6 > 6700 {  
count = count + 1  
printf "%3f %20s %-12s %d\n", count, $2, $3, $6 }' empn.lst
```

THE -f OPTION: STORING awk PROGRAMS IN A FILE

You should hold large awk programs in separate files and provide them with the awk extension for easier identification. Let's first store the previous program in the file `empawk.awk`:

```
$ cat empawk.awk
```

Observe that this time we haven't used quotes to enclose the awk program. You can now use awk with the `-f filename` option to obtain the same output:

```
Awk -F'|' -f empawk.awk empn.lst
```

THE BEGIN AND END SECTIONS

Awk statements are usually applied to all lines selected by the address, and if there are no addresses, then they are applied to every line of input. But, if you have to print something before processing the first line, for example, a heading, then the BEGIN section can be used gainfully. Similarly, the end section is useful in printing some totals after processing is over.

The BEGIN and END sections are optional and take the form

BEGIN {action}

END {action}

These two sections, when present, are delimited by the body of the awk program. You can use them to print a suitable heading at the beginning and the average salary at the end.

BUILT-IN VARIABLES

Awk has several built-in variables. They are all assigned automatically, though it is also possible for a user to reassign some of them. You have already used `NR`, which signifies the record number of the current line. We'll now have a brief look at some of the other variables.

The FS Variable: as stated elsewhere, awk uses a contiguous string of spaces as the default field delimiter. `FS` redefines this field separator, which in the sample database happens to be the `|`. When used at all, it must occur in the BEGIN section so that the body of the program knows its value before it starts processing:

```
BEGIN {FS="|"}  
This is an alternative to the -F option which does the same thing.
```

The OFS Variable: when you used the print statement with comma-separated arguments, each argument was separated from the other by a space. This is awk's default output field separator, and can be reassigned using the variable `OFS` in the BEGIN section:

```
BEGIN { OFS="~" }
```

When you reassign this variable with a ~ (tilde), awk will use this character for delimiting the print arguments. This is a useful variable for creating lines with delimited fields.

The NF variable: NF comes in quite handy for cleaning up a database of lines that don't contain the right number of fields. By using it on a file, say emp.lst, you can locate those lines not having 6 fields, and which have crept in due to faulty data entry:

```
$awk 'BEGIN {FS = "|"}'
```

```
NF!=6 {
```

```
Print "Record No ", NR, "has", "fields"}' emp.lst
```

The FILENAME Variable: FILENAME stores the name of the current file being processed. Like grep and sed, awk can also handle multiple filenames in the command line. By default, awk doesn't print the filename, but you can instruct it to do so:

```
'$6<4000 {print FILENAME, $0}'
```

With FILENAME, you can device logic that does different things depending on the file that is processed.

NS2 Installation

- NS2 is a free simulation tool.
- It runs on various platforms including UNIX (or Linux), Windows, and Mac systems.
- NS2 source codes are distributed in two forms: the all-in-one suite and the component-wise.
- 'all-in-one' package provides an "install" script which configures the NS2 environment and creates NS2 executable file using the "make" utility.

NS-2 installation steps in Linux

- Go to **Computer · File System** · now paste the zip file "**ns-allinone-2.34.tar.gz**" into opt folder.
- Now **unzip** the file by typing the following **command**
[root@localhost opt] # **tar -xzf ns-allinone-2.34.tar.gz**
- After the files get extracted, we get ns-allinone-2.34 folder as well as zip file ns-allinone- 2.34.tar.gz
[root@localhost opt] # **ns-allinone-2.34 ns-allinone-2.34.tar.gz**
- Now go to ns-allinone-2.33 folder and install
it [root@localhost opt] # **cd ns-allinone-2.34**
[root@localhost ns-allinone-2.33] # **./install**
- Once the installation is completed successfully we get certain pathnames in that terminal which must be pasted in "**.bash_profile**" file.
- First **minimize the terminal** where installation is done and **open a new terminal** and open the file "**.bash_profile**"
[root@localhost ~] # **vi .bash_profile**
- When we open this file, we get a line in that file which is shown below

```
PATH=$PATH:$HOME/bin
```

To this line we must paste the path which is present in the previous terminal where **ns** was installed. First put ":" then paste the path in-front of bin. That path is shown below.

```
"/opt/ns-allinone-2.33/bin:/opt/ns-allinone-2.33/tcl8.4.18/unix:/opt/ns-allinone-2.33/tk8.4.18/unix"
```

- In the next line type "**LD_LIBRARY_PATH=\$LD_LIBRARY_PATH:**" and paste the **two paths** separated by ":" which are present in the previous terminal i.e **Important notices section (1)**

```
"/opt/ns-allinone-2.33/otcl-1.13:/opt/ns-allinone-2.33/lib"
```

- In the next line type “**TCL_LIBRARY=\$TCL_LIBRARY:**” and paste the path which is present in previous terminal i.e **Important Notices section (2)** “**/opt/ns-allinone-2.33/tcl8.4.18/library**”
- In the next line type “**export LD_LIBRARY_PATH**”
- In the next line type “**export TCL_LIBRARY**”
- The next two lines are already present the file “**export PATH**” and “**unset USERNAME**”
- **Save the program (ESC + shift : wq and press enter)**
- Now in the terminal where we have opened **.bash_profile** file, type the following command to **check if path is updated correctly or not**

```
[root@localhost ~] # vi .bash_profile
[root@localhost ~] # source .bash_profile
```
- If **path is updated properly**, then we will **get the prompt** as shown below

```
[root@localhost ~] #
```
- Now open the previous terminal where you have installed **ns**

```
[root@localhost ns-allinone-2.33] #
```
- Here we need to configure three packages “**ns-2.33**”, “**nam-1.13**” and “**xgraph-12.1**”
- **First**, configure “**ns-2.33**” package as shown below

```
[root@localhost ns-allinone-2.33] # cd ns-2.33
[root@localhost ns-2.33] # ./configure
[root@localhost ns-2.33] # make clean
[root@localhost ns-2.33] # make
[root@localhost ns-2.33] # make install
[root@localhost ns-2.33] # ns
%
```
- If we get “**%**” symbol it indicates that **ns-2.33 configuration** was **successful**.
- **Second**, configure “**nam-1.13**” package as shown below

```
[root@localhost ns-2.33] # cd ..
[root@localhost ns-allinone-2.33] # cd nam-1.13
[root@localhost nam-1.13] # ./configure
[root@localhost nam-1.13] # make clean
[root@localhost nam-1.13] # make
[root@localhost nam-1.13] # make install
[root@localhost nam-1.13] # ns
%
```
- If we get “**%**” symbol it indicates that **nam-1.13 configuration** was **successful**.
- **Third**, configure “**xgraph-12.1**” package as shown below

```
[root@localhost nam-1.13] # cd ..
[root@localhost ns-allinone-2.33] # cd xgraph-12.1
[root@localhost xgraph-12.1] # ./configure
[root@localhost xgraph-12.1] # make clean
[root@localhost xgraph-12.1] # make
[root@localhost xgraph-12.1] # make install
[root@localhost xgraph-12.1] # ns
%
```

This completes the installation process of “NS-2” simulator.

PART-A

1. Implement three nodes point – to – point network with duplex links between them. Set the queue size, vary the bandwidth and find the number of packets dropped.

```
set ns [new Simulator] /* Letter S is capital */
set nf [open lab1.nam w] /* open a nam trace file in write mode */
$ns namtrace-all $nf /* nf – nam file */

AWK file (Open a new editor using “vi command” and write awk file and save with “.awk” extension)

```

/*immediately after BEGIN should open braces ‘{‘
BEGIN {
c=0;
}
{
  If ($1= "d")
  {
    c++;
    printf("%s\t%s\n",$5,$11);
  }
}
/*immediately after END should open braces ‘{‘
END{
  printf("The number of packets dropped =%d\n",c);
}

```

Steps for execution

- 1) Open vi editor and type program. Program name should have the extension “.tcl”
[root@localhost ~]# vi lab1.tcl
- 2) Save the program by pressing “ESC key” first, followed by “Shift and :” keys simultaneously and type “wq” and press Enter key.
- 3) Open vi editor and type awk program. Program name should have the extension “.awk”
[root@localhost ~]# vi lab1.awk
- 4) Save the program by pressing “ESC key” first, followed by “Shift and :” keys simultaneously and type “wq” and press Enter key.
- 5) Run the simulation program
[root@localhost~]# ns lab1.tcl
 - i) Here “ns” indicates network simulator. We get the topology shown in the snapshot.
 - ii) Now press the play button in the simulation window and the simulation will begins.
- 6) After simulation is completed run awk file to see the output ,

```
[root@localhost~]# awk -f lab1.awk lab1.tr
```

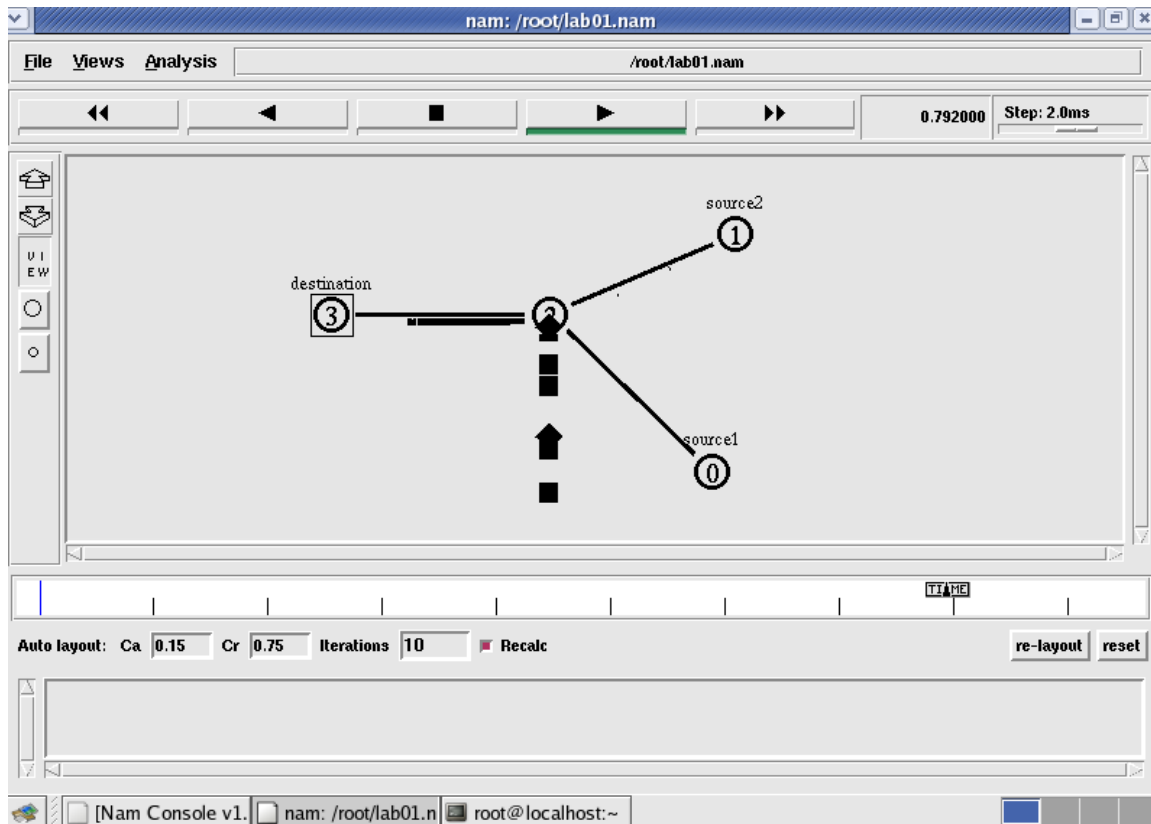

7) To see the trace file contents open the file as ,

```
[root@localhost~]# vi lab1.tr
```

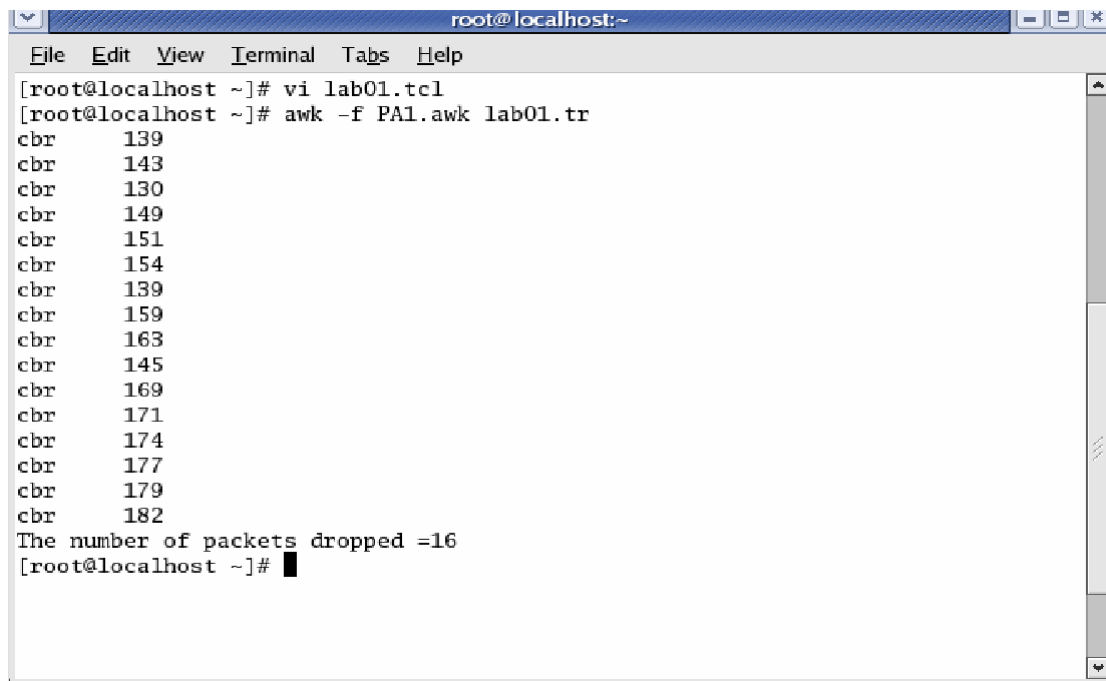

Trace file contains 12 columns:-

Event type, Event time, From Node, Source Node, Packet Type, Packet Size, Flags (indicated by -----), Flow ID, Source address, Destination address, Sequence ID, Packet ID

Topology

Output

The number of packets dropped =16  
[root@localhost ~]#
```

Note:

1. Set the queue size fixed from n0 to n2 as 10, n1-n2 to 10 and from n2-n3 as 5.
Syntax: To set the queue size
\$ns set queue-limit <from> <to> <size> Eg:
\$ns set queue-limit \$n0 \$n2 10
2. Go on varying the bandwidth from 10, 20 30 . . and find the number of packets dropped at the node 2

2. Implement transmission of ping messages/trace route over a network topology consisting of 6 nodes and find the number of packets dropped due to congestion.

AWK file (Open a new editor using “vi command” and write awk file and save with “.awk” extension)

```

BEGIN{
drop=0;
}
{
if($1=="d" )
{
drop++;
}
}
END{
printf("Total number of %s packets dropped due to congestion =%d\n",$5,drop);
}

```

Steps for execution

- 1) Open vi editor and type program. Program name should have the extension “.tcl”
[root@localhost ~]# vi lab2.tcl
- 2) Save the program by pressing “ESC key” first, followed by “Shift and :” keys simultaneously and type “wq” and press **Enter key**.
- 3) Open vi editor and type **awk** program. Program name should have the extension “.awk”
[root@localhost ~]# vi lab2.awk
- 4) Save the program by pressing “ESC key” first, followed by “Shift and :” keys simultaneously and type “wq” and press **Enter key**.
- 5) Run the simulation program
[root@localhost~]# ns lab2.tcl
 - i) Here “ns” indicates network simulator. We get the topology shown in the snapshot.
 - ii) Now press the play button in the simulation window and the simulation will begins.
- 6) After simulation is completed run **awk file** to see the output ,
[root@localhost~]# awk -f lab2.awk lab2.tr
- 7) To see the trace file contents open the file as ,
[root@localhost~]# vi lab2.tr

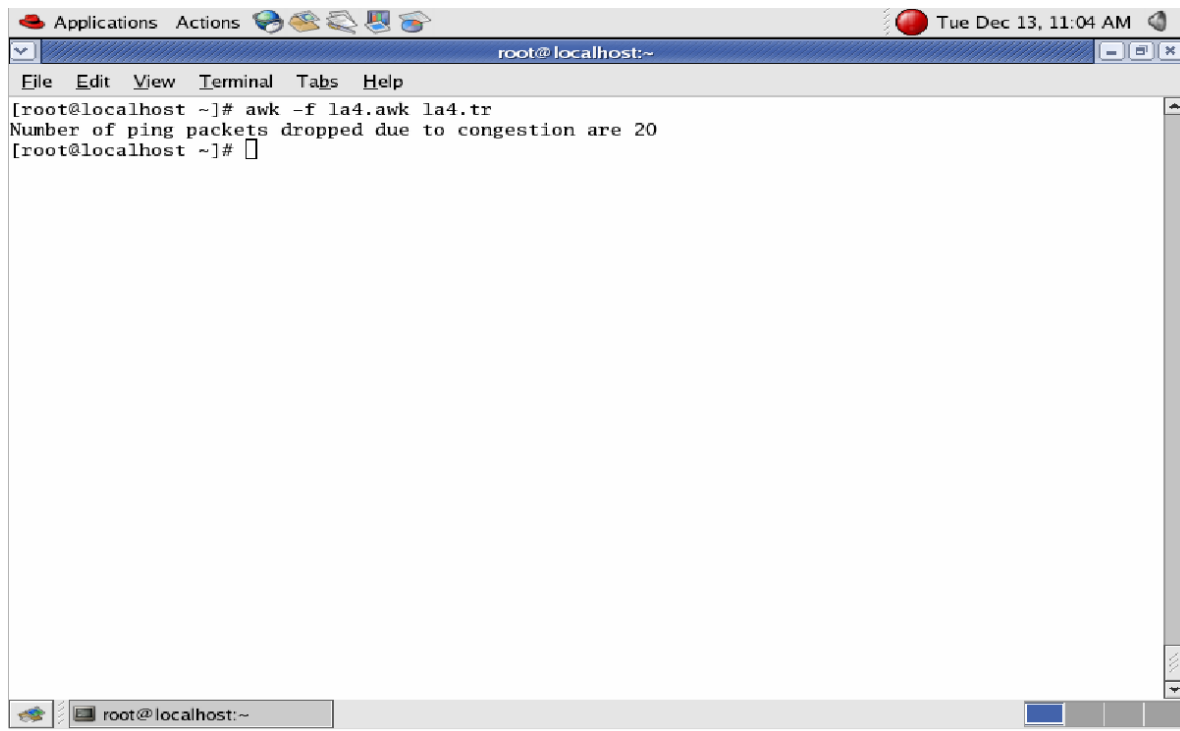

The screenshot displays the NAM (Network Animator) application window. The title bar indicates the current file is `nam: /root/la4.nam`. The main window is divided into several sections:

- Top Bar:** Contains the menu bar (File, Views, Analysis) and a toolbar with navigation icons (back, forward, home, etc.).
- Status Bar:** Shows the current time as `0.338000` and the step as `Step: 2.0ms`.
- Diagram Area:** The central workspace displays a network topology. A central node labeled `4` is connected to five other nodes: `src1` (0), `src2` (2), `dest` (5), `test` (3), and another `dest` (5). The nodes are represented by circles with numbers inside, and the connections are solid lines.
- Timeline:** A horizontal timeline at the bottom shows the simulation progress, with a play button and a 'Recalc' button.
- Bottom Bar:** Displays the current host as `root@localhost:~` and the application version as `[Nam Console v1]`.

The screenshot shows a terminal window titled "root@localhost:~". The terminal output displays a series of ping results between two hosts, identified by IP addresses 192.168.1.5 and 192.168.1.3. The results are as follows:

Host	Received	From	With	Round Trip Time (msec)
192.168.1.5	node 0	received	from 5	72.1
192.168.1.3	node 2	received	from 3	88.1
192.168.1.5	node 0	received	from 5	72.1
192.168.1.3	node 2	received	from 3	88.1
192.168.1.5	node 0	received	from 5	72.1
192.168.1.3	node 2	received	from 3	88.1
192.168.1.5	node 0	received	from 5	72.1
192.168.1.3	node 2	received	from 3	88.1
192.168.1.5	node 0	received	from 5	72.1
192.168.1.3	node 2	received	from 3	88.1
192.168.1.5	node 0	received	from 5	72.1
192.168.1.3	node 2	received	from 3	88.1
192.168.1.5	node 0	received	from 5	72.1
192.168.1.3	node 2	received	from 3	88.1
192.168.1.5	node 0	received	from 5	72.1
192.168.1.3	node 2	received	from 3	88.1
192.168.1.5	node 0	received	from 5	72.1
192.168.1.3	node 2	received	from 3	88.1
192.168.1.5	node 0	received	from 5	72.1
192.168.1.3	node 2	received	from 3	88.1
192.168.1.5	node 0	received	from 5	72.1
192.168.1.3	node 2	received	from 3	88.1

The terminal prompt is currently at [root@localhost ~]#.

The screenshot shows a terminal window titled "root@localhost:~". The window has a menu bar with "File", "Edit", "View", "Terminal", "Tabs", and "Help". The terminal content shows the command `awk -f la4.awk la4.tr` being executed, followed by the output "Number of ping packets dropped due to congestion are 20". The prompt `[root@localhost ~]#` is visible at the end of the line. The window's title bar includes "Applications", "Actions", and a clock showing "Tue Dec 13, 11:04 AM".

```
[root@localhost ~]# awk -f la4.awk la4.tr
Number of ping packets dropped due to congestion are 20
[root@localhost ~]#
```

Note:

Vary the bandwidth and queue size between the nodes n0-n2 , n2-n4. n6-n2 and n2- n5 and see the number of packets dropped at the nodes.

3. Implement an Ethernet LAN using n nodes and set multiple traffic nodes and plot congestion window for different source / destination.

```
set ns [new Simulator]
set tf [open lab3.tr w]
$ns trace-all $tf
set nf [open lab3.nam w]
$ns namtrace-all $nf

set n0 [$ns node]
$n0 color "magenta"
$n0 label "src1"
set n1 [$ns node]
set n2 [$ns node]
$n2 color "magenta"
$n2 label "src2"
set n3 [$ns node]
$n3 color "blue"
$n3 label "dest2"
set n4 [$ns node]

set n5 [$ns node]
$n5 color "blue"
$n5 l
abel "dest1"

$ns make-lan "$n0 $n1 $n2 $n3 $n4" 100Mb 100ms LL Queue/DropTail Mac/802_3
/* should come in single line */
$ns duplex-link $n4 $n5 1Mb 1ms DropTail

set tcp0 [new Agent/TCP]
$ns attach-agent $n0 $tcp0
set ftp0 [new Application/FTP]
$ftp0 attach-agent $tcp0
$ftp0 set packetSize_ 500
$ftp0 set interval_ 0.0001
set sink5 [new Agent/TCPSink]
$ns attach-agent $n5 $sink5

$ns connect $tcp0 $sink5

set tcp2 [new Agent/TCP]
$ns attach-agent $n2 $tcp2
set ftp2 [new Application/FTP]
$ftp2 attach-agent $tcp2
$ftp2 set packetSize_ 600
$ftp2 set interval_ 0.001
set sink3 [new Agent/TCPSink]
$ns attach-agent $n3 $sink3

$ns connect $tcp2 $sink3
```

```

set file1 [open file1.tr w]
$tcp0 attach $file1
set file2 [open file2.tr w]
$tcp2 attach $file2

```

```

$tcp0 trace cwnd_ /* must put underscore ( _ ) after cwnd and no space between them */
$tcp2 trace cwnd_

```

```

proc finish { } {
    global ns nf tf
    $ns flush-trace
    close $tf
    close $nf
    exec nam lab3.nam &
    exit 0
}
$ns at 0.1 "$ftp0 start"
$ns at 5 "$ftp0 stop"
$ns at 7 "$ftp0 start"
$ns at 0.2 "$ftp2 start"
$ns at 8 "$ftp2 stop"
$ns at 14 "$ftp0 stop"
$ns at 10 "$ftp2 start"
$ns at 15 "$ftp2 stop"
$ns at 16 "finish"
$ns run

```

AWK file (Open a new editor using “vi command” and write awk file and save with “.awk” extension)

cwnd:- means congestion window

```

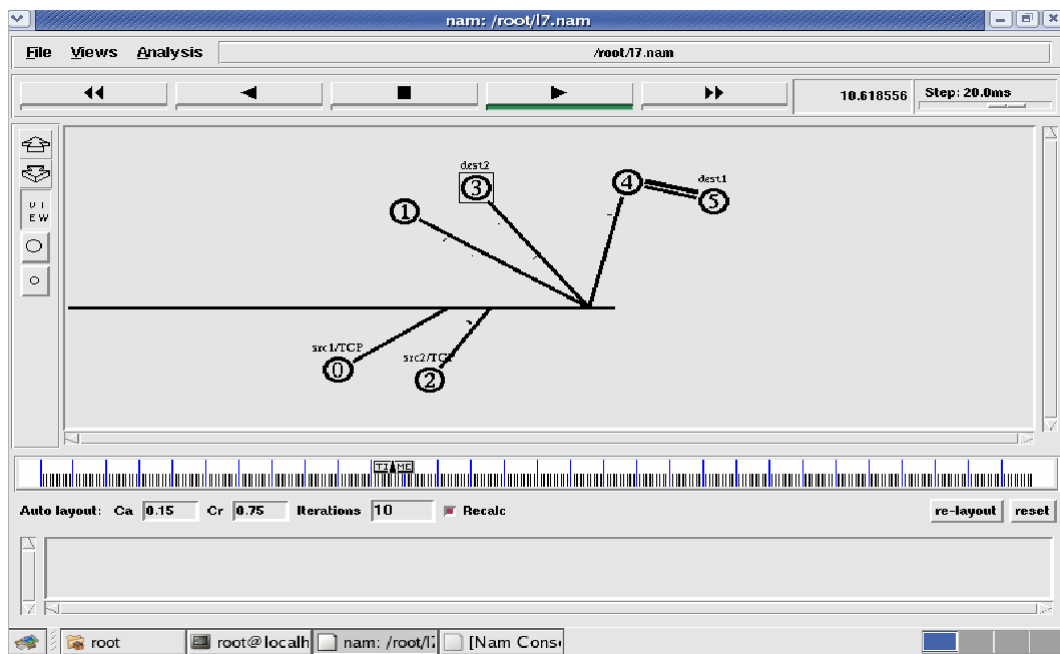

BEGIN {
}
{
    if($6=="cwnd_") /* don't leave space after writing cwnd_ */
    printf("%f\t%f\t\n",$1,$7); /* you must put \n in printf */
}
END {
}

```

Steps for execution

- 1) Open vi editor and type program. Program name should have the extension “**.tcl**”
[root@localhost ~]# vi lab3.tcl
- 2) Save the program by pressing “**ESC key**” first, followed by “**Shift and :**” keys simultaneously and type “**wq**” and press **Enter key**.
- 3) Open vi editor and type **awk** program. Program name should have the extension “**.awk**”
[root@localhost ~]# vi lab3.awk
- 4) Save the program by pressing “**ESC key**” first, followed by “**Shift and :**” keys simultaneously and type “**wq**” and press **Enter key**.
- 5) Run the simulation program
[root@localhost~]# ns lab3.tcl
- 6) After simulation is completed run **awk file** to see the output ,
 - i. **[root@localhost~]# awk -f lab3.awk file1.tr > a1**
 - ii. **[root@localhost~]# awk -f lab3.awk file2.tr > a2**
 - iii. **[root@localhost~]# xgraph a1 a2**
- 7) Here we are using the congestion window trace files i.e. **file1.tr** and **file2.tr** and we are redirecting the contents of those files to new files say **a1** and **a2** using **output redirection operator (>)**.
- 8) To see the trace file contents open the file as ,
[root@localhost~]# vi lab3.tr

Topology

Output

4. Implement simple ESS and with transmitting nodes in wire-less LAN by simulation and determine the performance with respect to transmission of packets.

```
set ns [new Simulator]

```

A terminal window titled "root@localhost:~" with a menu bar containing "File", "Edit", "View", "Terminal", "Tabs", and "Help". The terminal content shows the execution of an awk script on a file named "lab8.tr". The output consists of two lines: "The Throughput from n0 to n1: 5863.442245Mbps" and "The Throughput from n1 to n2: 1307.611834 Mbps". The prompt "[root@localhost ~]#" is visible at the end of each line, with a cursor at the end of the second line.

```
[root@localhost ~]# awk -f lab8.awk lab8.tr
The Throughput from n0 to n1: 5863.442245Mbps
The Throughput from n1 to n2: 1307.611834 Mbps[root@localhost ~]#
```

5. Implement and study the performance of GSM on NS2/NS3 (Using MAC layer) or equivalent environment.

Second Generation (2G) technology is based on the technology known as global system for mobile communication (GSM). This technology enabled various networks to provide services like text messages, picture messages and MMS. The technologies used in 2G are either TDMA (Time Division Multiple Access) which divides signal into different time slots or CDMA (Code Division Multiple Access) which allocates a special code to each user so as to communicate over a multiplex physical channel.

GSM uses a variation of time division multiple access (TDMA). 2G networks developed as a replacement for first generation (1G) analog cellular networks, and the GSM standard originally described as a digital, circuit-switched network optimized for full duplex voice telephony. This expanded over time to include data communications, first by circuit-switched transport, then by packet data transport via GPRS (General Packet Radio Services).

GSM can be implemented on all the versions of NS2 (Since year 2004: ns-2.27, and later versions of NS2)

Design:

```

6. Implement and study the performance of CDMA on NS2/NS3 (Using stack called Call net) or equivalent environment.

3G networks developed as a replacement for second generation (2G) GSM standard network with full duplex voice telephony. CDMA is used as the access method in many mobile phone standards. IS-95, also called cdmaOne, and its 3G evolution CDMA2000, are often simply referred to as CDMA, but UMTS(The Universal Mobile Telecommunications System is a third generation mobile cellular system for networks based on the GSM standard.), the 3G standard used by GSM carriers, also uses wideband CDMA. Long-Term Evolution (LTE) is a standard for high-speed wireless communication which uses CDMA network technology.

3G technology generally refers to the standard of accessibility and speed of mobile devices. The standards of the technology were set by the International Telecommunication Union (ITU). This technology enables use of various services like GPS (Global Positioning System), mobile television and video conferencing. It not only enables them to be used worldwide, but also provides with better bandwidth and increased speed. The main aim of this technology is to allow much better coverage and growth with minimum investment.

CDMA can be implemented on all the versions of NS2 (Since year 2004: ns-2.27, and later versions of NS2)

Design:

```

PART B – Programming Exercises**1. Write a program for error detecting code using CRC-CCITT (16- bits).**

Whenever digital data is stored or interfaced, data corruption might occur. Since the beginning of computer science, developers have been thinking of ways to deal with this type of problem. For serial data they came up with the solution to attach a parity bit to each sent byte. This simple detection mechanism works if an odd number of bits in a byte changes, but an even number of false bits in one byte will not be detected by the parity check. To overcome this problem developers have searched for mathematical sound mechanisms to detect multiple false bits. The **CRC** calculation or *cyclic redundancy check* was the result of this. Nowadays CRC calculations are used in all types of communications. All packets sent over a network connection are checked with a CRC. Also each data block on your hard disk has a CRC value attached to it. Modern computer world cannot do without these CRC calculations. So let's see why they are so widely used. The answer is simple; they are powerful, detect many types of errors and are extremely fast to calculate especially when dedicated hardware chips are used.

```
import java.io.*;
class Crc
{
    public static void main(String args[]) throws IOException
    {
        BufferedReader br=new BufferedReader(new InputStreamReader(System.in));
        int[ ] data;
        int[ ]div;
        int[ ]divisor;
        int[ ]rem;
        int[ ] crc;
        int data_bits, divisor_bits, tot_length;

        System.out.println("Enter number of data bits : ");
        data_bits=Integer.parseInt(br.readLine());
        data=new int[data_bits];

        System.out.println("Enter data bits : ");
        for(int i=0; i<data_bits; i++)
            data[i]=Integer.parseInt(br.readLine());

        System.out.println("Enter number of bits in divisor : ");
        divisor_bits=Integer.parseInt(br.readLine());
        divisor=new int[divisor_bits];

        System.out.println("Enter Divisor bits : ");
        for(int i=0; i<divisor_bits; i++)
            divisor[i]=Integer.parseInt(br.readLine());
```

```
/* System.out.print("Data bits are : ");
for(int i=0; i< data_bits; i++)
    System.out.print(data[i]);

System.out.println();

System.out.print("divisor bits are : ");
for(int i=0; i< divisor_bits; i++)
    System.out.print(divisor[i]);

System.out.println();
*/

tot_length=data_bits+divisor_bits-1;
div=new int[tot_length];
rem=new int[tot_length];
crc=new int[tot_length];

/*----- CRC GENERATION-----*/
for(int i=0;i<data.length;i++)
    div[i]=data[i];

System.out.print("Dividend (after appending 0's) are : ");
for(int i=0; i< div.length; i++)
    System.out.print(div[i]);
System.out.println();

for(int j=0; j<div.length; j++){
    rem[j] = div[j];
}

rem=divide(div, divisor, rem);
for(int i=0;i<div.length;i++) //append dividend and remainder
{
    crc[i]=(div[i]^rem[i]);
}

System.out.println();
System.out.println("CRC code : ");
for(int i=0;i<crc.length;i++)
    System.out.print(crc[i]);

/*-----ERROR DETECTION-----*/
System.out.println();
System.out.println("Enter CRC code of "+tot_length+" bits : ");
for(int i=0; i<crc.length; i++)
    crc[i]=Integer.parseInt(br.readLine());

/* System.out.print("crc bits are : ");
```

```

        for(int i=0; i< crc.length; i++)
            System.out.print(crc[i]);
        System.out.println();
        */

        for(int j=0; j<crc.length; j++){
            rem[j] = crc[j];
        }
        rem=divide(crc, divisor, rem);

        for(int i=0; i< rem.length; i++)
        {
            if(rem[i]!=0)
            {
                System.out.println("Error: The data with CRC has data bit errors");
                break;
            }
            if(i==rem.length-1)
                System.out.println("No Error: The data with CRC is proper");
        }
    }

    static int[] divide(int div[],int divisor[], int rem[])
    {
        int cur=0;
        while(true)
        {
            for(int i=0;i<divisor.length;i++)
                rem[cur+i]=(rem[cur+i]^divisor[i]);

            while(rem[cur]==0 && cur!=rem.length-1)
                cur++;

            //Check if we have reached the end of division
            if((rem.length-cur)<divisor.length)
                break;
        }
        return rem;
    }
}

```

Output of the program:

1
0
1
No Error: The data with CRC is proper
```

2. Write a program to find the shortest path between vertices using bellman-ford algorithm.

Distance Vector Algorithm is a decentralized routing algorithm that requires that each router simply inform its neighbors of its routing table. For each network path, the receiving routers pick the neighbor advertising the lowest cost, then add this entry into its routing table for re-advertisement. To find the shortest path, Distance Vector Algorithm is based on one of two basic algorithms: the Bellman-Ford and the Dijkstra algorithms.

Routers that use this algorithm have to maintain the distance tables (which is a one- dimension array -- "a vector"), which tell the distances and shortest path to sending packets to each node in the network. The information in the distance table is always up date by exchanging information with the neighboring nodes. The number of data in the table equals to that of all nodes in networks (excluded itself). The columns of table represent the directly attached neighbors whereas the rows represent all destinations in the network. Each data contains the path for sending packets to each destination in the network and distance/or time to transmit on that path (we call this as "cost"). The measurements in this algorithm are the number of hops, latency, the number of outgoing packets, etc.

The Bellman–Ford algorithm is an algorithm that computes shortest paths from a single source vertex to all of the other vertices in a weighted digraph. It is slower than Dijkstra's algorithm for the same problem, but more versatile, as it is capable of handling graphs in which some of the edge weights are negative numbers. Negative edge weights are found in various applications of graphs, hence the usefulness of this algorithm. If a graph contains a "negative cycle" (i.e. a cycle whose edges sum to a negative value) that is reachable from the source, then there is no cheapest path: any path that has a point on the negative cycle can be made cheaper by one more walk around the negative cycle. In such a case, the Bellman–Ford algorithm can detect negative cycles and report their existence

```
import java.util.Scanner;
public class BellmanFord
{
    private int D[];
    private int num_ver;
    public static final int MAX_VALUE = 999;

    public BellmanFord(int num_ver)
    {
        this.num_ver = num_ver;
        D = new int[num_ver + 1];
    }

    public void BellmanFordEvaluation(int source, int A[][])
    {
        for (int node = 1; node <= num_ver; node++)
        {
```

```

        D[node] = MAX_VALUE;
    }
    D[source] = 0;
    for (int node = 1; node <= num_ver - 1; node++)
    {
        for (int sn = 1; sn <= num_ver; sn++)
        {
            for (int dn = 1; dn <= num_ver; dn++)
            {
                if (A[sn][dn] != MAX_VALUE)
                {
                    if (D[dn] > D[sn] + A[sn][dn])
                        D[dn] = D[sn] + A[sn][dn];
                }
            }
        }
    }

    for (int sn = 1; sn <= num_ver; sn++)
    {
        for (int dn = 1; dn <= num_ver; dn++)
        {
            if (A[sn][dn] != MAX_VALUE)
            {
                if (D[dn] > D[sn] + A[sn][dn])
                    System.out.println("The Graph contains negative egde
cycle");
            }
        }
    }

    for (int vertex = 1; vertex <= num_ver; vertex++)
    {
        System.out.println("distance of source " + source + " to " + vertex + " is " +
D[vertex]);
    }
}

public static void main(String[ ] args)
{
    int num_ver = 0;
    int source;
    Scanner scanner = new Scanner(System.in);

    System.out.println("Enter the number of vertices");
    num_ver = scanner.nextInt();
    int A[][] = new int[num_ver + 1][num_ver + 1];

    System.out.println("Enter the adjacency matrix");

```

```
        for (int sn = 1; sn <= num_ver; sn++)
        {
            for (int dn = 1; dn <= num_ver; dn++)
            {
                A[sn][dn] = scanner.nextInt();
                if (sn == dn)
                {
                    A[sn][dn] = 0;
                    continue;
                }
                if (A[sn][dn] == 0)
                {
                    A[sn][dn] = MAX_VALUE;
                }
            }
        }

        System.out.println("Enter the source vertex");
        source = scanner.nextInt();

        BellmanFord b = new BellmanFord (num_ver);
        b.BellmanFordEvaluation(source, A);
        scanner.close();
    }
}
```

Output of the program is:

=====

Enter the number of vertices

4

Enter the adjacency matrix

0 5 0 0

5 0 3 4

0 3 0 2

0 4 2 0

Enter the source vertex

2

distance of source 2 to 1 is 5

distance of source 2 to 2 is 0

distance of source 2 to 3 is 3

distance of source 2 to 4 is 4

3. Using TCP/IP sockets, write a client – server program to make the client send the file name and to make the server send back the contents of the requested file if present. Implement the above program using as message queues or FIFOs as IPC channels.

Socket is an interface which enables the client and the server to communicate and pass on information from one another. Sockets provide the communication mechanism between two computers using TCP. A client program creates a socket on its end of the communication and attempts to connect that socket to a server. When the connection is made, the server creates a socket object on its end of the communication. The client and the server can now communicate by writing to and reading from the socket.

```
// Client Program
import java.io.BufferedReader;
import java.io.DataInputStream;
import java.io.DataOutputStream;
import java.io.EOFException;
import java.io.File;
import java.io.FileOutputStream;
import java.io.InputStreamReader;
import java.net.Socket;
import java.util.Scanner;

class Client {
    public static void main(String args[]) throws Exception {
        String address = "";
        Scanner sc = new Scanner(System.in);

        System.out.println("Enter Server Address: ");
        address = sc.nextLine();

        // create the socket on port 8000
        Socket s = new Socket(address, 8000);
        DataInputStream din = new DataInputStream(s.getInputStream());
        DataOutputStream dout = new DataOutputStream(s.getOutputStream());
        BufferedReader br = new BufferedReader(new InputStreamReader(System.in));
        System.out.println("Send Get to start...");
        String str = "", filename = "";
        try {
            while (!str.equals("start"))
                str = br.readLine();

            dout.writeUTF(str);
            dout.flush();
            filename = din.readUTF();

            System.out.println("Receiving file: " + filename);
            filename = "client" + filename;

            System.out.println("Saving as file: " + filename);
            long sz = Long.parseLong(din.readUTF());
```

```

        System.out.println("File Size: " + (float) (sz / (1024 * 1024)) + " MB");
        byte b[] = new byte[1024];

        System.out.println("Receiving file..");
        FileOutputStream fos = new FileOutputStream(new File(filename), true);

        long bytesRead;
        /*
        do {
            bytesRead = din.read(b, 0, b.length);
            fos.write(b, 0, b.length);
        } while (!(bytesRead < 1024));
        */

        do {
            bytesRead = din.read(b, 0, b.length);
            System.out.println(b);
            if(bytesRead != -1)
                fos.write(b, 0, b.length);
        } while (bytesRead > 0);

        System.out.println("Completed");
        fos.close();
        dout.close();
        s.close();
    } catch (EOFException e) {
        // do nothing
    }
}
}
}

```

```

//Server Program
import java.io.DataInputStream;
import java.io.DataOutputStream;
import java.io.File;
import java.io.FileInputStream;
import java.net.ServerSocket;
import java.net.Socket;
import java.util.Scanner;

class Server {
    public static void main(String args[]) throws Exception {
        String filename;
        System.out.println("Enter File Name: ");
        Scanner sc = new Scanner(System.in);
        filename = sc.nextLine();
        sc.close();
        while (true) {

```

```

// create server socket on port 8000
ServerSocket ss = new ServerSocket(8000);
System.out.println("Waiting for request");
Socket s = ss.accept();
System.out.println("Connected With "
    + s.getInetAddress().toString());
DataInputStream din = new DataInputStream(s.getInputStream());
DataOutputStream dout = new DataOutputStream(s.getOutputStream());
try {
    String str = "";
    str = din.readUTF();
    System.out.println("SendGet....Ok");
    if (!str.equals("stop")) {
        System.out.println("Sending File: " + filename);
        dout.writeUTF(filename);
        dout.flush();
        File f = new File(filename);
        FileInputStream fin = new FileInputStream(f);
        long sz = (int) f.length();
        byte b[] = new byte[1024];
        int read;
        dout.writeUTF(Long.toString(sz));
        dout.flush();
        System.out.println("Size: " + sz);
        System.out
            .println("Buf size: " +
ss.getReceiveBufferSize());

        while ((read = fin.read(b, 0, b.length)) != -1) {

            //Neha Print the data read
            System.out.println(b);

            dout.write(b, 0, read);

            dout.flush();
        }
        fin.close();
        System.out.println("..ok");
        dout.flush();
    }
    dout.writeUTF("stop");
    System.out.println("Send Complete");
    dout.flush();
} catch (Exception e) {
    e.printStackTrace();
    System.out.println("An error occurred");
}
din.close();
s.close();

```

```

        ss.close();
    }
}

```

Note: Create two different files Client.java and Server.java. Follow the steps given:

1. Open a terminal run the server program and provide the filename to send
2. Open one more terminal run the client program and provide the IP address of the server. We can give localhost address “127.0.0.1” as it is running on same machine or give the IP address of the machine.
3. Send any start bit to start sending file.
4. Refer https://www.tutorialspoint.com/java/java_networking.htm for all the parameters, methods description in socket communication.

```

Using TCP/IP sockets, write a client – server program to make the client send the file name and to make the server send back the contents of the requested file if present. Implement the above program using as message queues or FIFOs as IPC channels.

In order to run this program you have to do the following:

Server

In one folder put the server code. Also put the file you want to transfer ex: bnmit.txt
 Compile the program and run it in one command prompt window.
 The program asks for the name of the file. Enter bnmit.txt
 Then the program waits for a connection from client

Client

In another folder put the client code. Compile the program and run it in another window.
 Client program now asks for server address. enter 127.0.0.1
 Now the client will get the file from server and save it in client folder

4. Write a program on datagram socket for client/server to display the messages on client side, typed at the server side.

A datagram socket is the one for sending or receiving point for a packet delivery service. Each packet sent or received on a datagram socket is individually addressed and routed. Multiple packets sent from one machine to another may be routed differently, and may arrive in any order.

Source Code:**UDP Client**

1. Open a terminal run the server program.
2. Open one more terminal run the client program, the sent message will be received.

Note: Create two different files UDPC.java and UDPS.java. Follow the following steps:

```
import java.io.*;
import java.net.*;

public class UDPC {
    public static void main(String[] args) {
        DatagramSocket skt;
        try {
            skt = new DatagramSocket();
            String msg = "text message ";
            byte[] b = msg.getBytes();
            InetAddress host =
InetAddress.getByName("127.0.0.1");
            int serverSocket = 6788;
            DatagramPacket request = new DatagramPacket(b,
b.length, host,
                        serverSocket);
            skt.send(request);
            byte[] buffer = new byte[1000];
            DatagramPacket reply = new DatagramPacket(buffer,
buffer.length);
            skt.receive(reply);
            System.out
                .println("client received:" + new
String(reply.getData()));
            skt.close();
        } catch (Exception ex) {
        }
    }
}
```

```

import java.io.*;
import java.net.*;

public class UDPS {
    public static void main(String[] args) {
        DatagramSocket skt = null;
        try {
            skt = new DatagramSocket(6788);
            byte[] buffer = new byte[1000];
            while (true) {
                DatagramPacket request = new
DatagramPacket(buffer,
                    buffer.length);
                skt.receive(request);
                String[] message = (new
String(request.getData())).split(" ");
                byte[] sendMsg = (message[1] + " server
processed").getBytes();
                DatagramPacket reply = new
DatagramPacket(sendMsg,
                    sendMsg.length, request.getAddress(),
request.getPort());
                skt.send(reply);
            }
        } catch (Exception ex) {
        }
    }
}

```

Write a program on datagram socket for client/server to display the messages on client side, typed at the server side

Server:

=====

Copy the UDPS.java in one folder and compile the program using the command: javac UDPS.java
then execute: java UDPS

Client:

=====

Copy the UDPC.java in another folder and compile the program using the command: javac UDPC.java
then execute: java UDPC

- 5. Write a program for simple RSA algorithm to encrypt and decrypt the data.**
1. Generate two large random primes, p and q , of approximately equal size such that their product $n = p \cdot q$
 2. Compute $n = p \cdot q$ and Euler's totient function (ϕ) $\phi(n) = (p-1)(q-1)$.
 3. Choose an integer e , $1 < e < \phi$, such that $\gcd(e, \phi) = 1$.
 4. Compute the secret exponent d , $1 < d < \phi$, such that $e \cdot d \equiv 1 \pmod{\phi}$.
 5. The public key is (e, n) and the private key is (d, n) . The values of p , q , and ϕ should also be kept secret.

RSA is an example of public key cryptography. It was developed by Rivest, Shamir and Adelman. The RSA algorithm can be used for both public key encryption and digital signatures. Its security is based on the difficulty of factoring large integers.

The RSA algorithm's efficiency requires a fast method for performing the modular exponentiation operation. A less efficient, conventional method includes raising a number (the input) to a power (the secret or public key of the algorithm, denoted e and d , respectively) and taking the remainder of the division with N . A straight-forward implementation performs these two steps of the operation sequentially: first, raise it to the power and second, apply modulo. The RSA algorithm comprises of three steps, which are depicted below:

Key Generation Algorithm

Encryption

Sender A does the following:-

1. Using the public key (e, n)
2. Represents the plaintext message as a positive integer M
3. Computes the cipher text $C = M^e \pmod{n}$.
4. Sends the cipher text C to B (Receiver).

Decryption

Recipient B does the following:-

1. Uses his private key (d, n) to compute $M = C^d \pmod{n}$.
2. Extracts the plaintext from the integer representative m .

6. Write a program for congestion control using leaky bucket algorithm.

The main concept of the leaky bucket algorithm is that the output data flow remains constant despite the variant input traffic, such as the water flow in a bucket with a small hole at the bottom. In case the bucket contains water (or packets) then the output flow follows a constant rate, while if the bucket is full any additional load will be lost because of spillover. In a similar way if the bucket is empty the output will be zero. From network perspective, leaky bucket consists of a finite queue (bucket) where all the incoming packets are stored in case there is space in the queue, otherwise the packets are discarded. In order to regulate the output flow, leaky bucket transmits one packet from

the queue in a fixed time (e.g. at every clock tick). In the following figure we can notice the main rationale of leaky bucket algorithm, for both the two approaches (e.g. leaky bucket with water (a) and with packets (b)).

(a) A leaky bucket with water

(b) A leaky bucket with packets

While leaky bucket eliminates completely bursty traffic by regulating the incoming data flow its main drawback is that it drops packets if the bucket is full. Also, it doesn't take into account the idle process of the sender which means that if the host doesn't transmit data for some time the bucket becomes empty without permitting the transmission of any packet.

Source Code:

```
import java.io.*;
import java.util.*;
public class Leaky
{
    public static void main(String args[]) throws Exception
    {
        Queue q=new Queue();
        Scanner src=new Scanner(System.in);
        System.out.println("\nEnter the packets to be sent:");
        int size=src.nextInt();

        q.insert(size);
        q.delete();
    }
}
```

```
class Queue
{
    int q[],f=0,r=0,size;
    void insert(int n)
    {
        Scanner in = new Scanner(System.in);
        q=new int[10];
        for(int i=0;i<n;i++)
        {
            System.out.print("\nEnter " + i + " element: ");
            int ele=in.nextInt();
            if(r+1>10)
            {
                System.out.println("\nQueue is full \nLost Packet: "+ele);
                break;
            }
            else
            {
                r++;
                q[i]=ele;
            }
        }
    }
}

void delete()
{
    Scanner in = new Scanner(System.in);
    Thread t=new Thread();
    if(r==0)
        System.out.print("\nQueue empty ");
    else
    {
        for(int i=f;i<r;i++)
        {
            try
            {
                t.sleep(1000);
            }

            catch(Exception e){}
            System.out.print("\nLeaked Packet: "+q[i]);
            f++;
        }
    }
    System.out.println();
}
```

```
}
```

Output:

```
Enter the packets to be sent:
```

```
12
```

```
Enter 0 element: 2
```

```
Enter 1 element: 3
```

```
Enter 2 element: 5
```

```
Enter 3 element: 6
```

```
Enter 4 element: 8
```

```
Enter 5 element: 9
```

```
Enter 6 element: 4
```

```
Enter 7 element: 5
```

```
Enter 8 element: 6
```

```
Enter 9 element: 2
```

```
Enter 10 element: 7
```

```
Enter 11 element: 3
```

Viva Questions

Part A

1. What does ns2 stands for?
2. What is the need of simulators in the network? How it will help?
3. What are nodes in the simulators?
4. How to change the transmission rate in ns2/
5. What is node config
6. What is the need of god?
7. Explain the trace file format?
8. How do we draw the graph in ns2?
9. How xgraph differs from gnuplot?
10. What is nam file and why do we need it?.
11. What is agent ?
12. List the different types of agents in ns2 to transmit the data
13. What is Ethernet?
14. How can the performance of GSM be measured?
15. What is CDMA?

Part B

1. What is cyclic redundancy check?
2. Explain the working of cyclic redundancy check algorithm.

3. With an example, explain how to find the shortest path using Distance Vector Algorithm.
4. Explain the client server architecture.
5. What is a socket?
6. How a socket is created in TCP/IP protocol?
7. What is inter process communication? Mention the types of inter process communication.
8. Differentiate between message queues and pipes.
9. Explain how inter process communication takes place between the client and server using FIFO.
10. Differentiate between encryption and decryption.
11. With an example, explain the working of RSA algorithm.
12. What is congestion? Explain the various methods of congestion control.
13. Explain how congestion can be controlled using Leaky Bucket algorithm.
